

Dredging

Production efficiency is a key factor for a profitable execution of dredging jobs. Specifically the operation of backhoe dipper dredgers require certain skills and experience from the man at the stick(s). Correct positioning of the barge, correct bucket angles when removing material, short cycle times, adherence to safety regulations it all has influence on a job well done.

With equipment out in the world on operations, a realistic simulator can facilitate this training and have the future crew gain experience. Tree C can supply such simulators at several levels of sophistication. Our simulators have been validated by experienced people from the field and allow for your own specifications.
